

Common Species at Red Rock

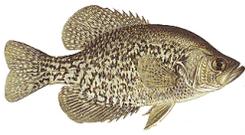

Walleye

Fish along the old river channel where the water depth drops off and along the face of the dam where sand and rock meets mud and grass. Also fish the river during cold weather months. Back trolling crank baits can provide fast action.

Largemouth Bass

Fish the rocks around the Marina point, the face of the dam among the rocks and off of the old Wallashuck boat ramp.

Crappie

Fish around underwater structures, brushy areas, Robert's Creek viaduct, near bridge pilings at the upper end of the lake, and Whitebreast Creek shallows prior to spawning. Use Jigs and minnows for bait.

White Bass

Fish the Whitebreast Creek shallows during spawning. In August there is a two-week time period when they are extremely easy to catch at locations like Marina point, Whitebreast point and any rocky shoreline. During other times of the year fish in the tailwater areas below the dam. Use 1/4, 1/8 or 1/16 oz white and or yellow jigs in tandem for bait.

Northern Pike

Fish in the Tailwater areas and use large lures with lots of flash such as spoons or crankbaits and a fast retrieve. Floating jigs with chubs or large minnows are effective in the spring.

Channel Catfish

Fish areas just above cut banks, snags, rocks and other submerged structures on the lake and in the river. Use cut bait or dead minnows during late winter and spring and use a prepared stink bait during the summer months when the lake is stable or rising.

Flathead Catfish

Fish with small sunfish under cut banks and holes on the river after dark.

Wiper (not pictured)

Cross between female striped bass and a male white bass.

Fish in the North and South Tailwater areas using a shad-like lure.
