The Rock Island District of the U.S. Army Corps of Engineers has enclosed for your use the Post-Construction Performance Evaluation Report Supplement (PERS2) for the Monkey Chute, Missouri, Habitat Rehabilitation and Enhancement Project (HREP), dated June 2001. This report is a product of 12 years of post-construction observations and field monitoring since project completion in 1989. A 15-year supplemental report is due out in March 2004.

Performance Evaluation Reports, both initial and supplemental, are the Corps of Engineers' primary mechanism for documenting and communicating the effectiveness of Upper Mississippi River System – Environmental Management Program (UMRS-EMP) HREP's.

A March 2001 draft of this report was provided to the project sponsors for their review and comment. These comments are incorporated into this version of the report.

Should you have any questions regarding the report, please contact Mr. Jon Fleischman or Mr. Dan Holmes at the U.S. Army Corps of Engineers Rock Island District, Design Branch. You may reach them at (309) 794-5159 with comments.

Sincerely,

Gary L. Loss, P.E.
Chief, Planning, Programs, and Project

ACKNOWLEDGMENT

Many individuals of the Rock Island District of the U.S. Army Corps of Engineers, the U.S. Fish and Wildlife Service, the Missouri Department of Conservation, and the Illinois Department of Natural Resources contributed to the development of this Supplemental Post-Construction Performance Evaluation Report for the Monkey Chute Habitat Rehabilitation and Enhancement Project. These individuals are listed below:

ROCK ISLAND DISTRICT, U.S. ARMY CORPS OF ENGINEERS (Corps)

PROGRAM MANAGER:	Roger Perk, P.E.
PROJECT ENGINEERS:	Alaena Ensey, P.E./Jon Fleischman, E.I.
TECHNICAL MANAGER:	Darron Niles
ENVIRONMENTAL ANALYSIS:	Charlene Carmack
FORESTRY:	Gary Swenson
CADD SUPPORT:	Tom Dumoulin

U.S. FISH AND WILDLIFE SERVICE (USFWS)

PROJECT LEADERS:	Dick Steinbach/Karen Westphall

EXECUTIVE SUMMARY
Monkey Chute Rehabilitation and Enhancement Project
Post-Construction Performance Evaluation Report

November 1989 through March 2001

Two goals of Monkey Chute Project:

A. Encourage main channel, oxygen-rich flow into the chute and retain 88 acres of backwater lake.

1. Sedimentation Monitoring

B. Encourage aquatic and biological use of backwater lake.

1. Aquatic Monitoring
2. Vegetation and Waterfowl Use Monitoring

A. Encourage main channel, oxygen-rich flow into the chute

1. *Operation and Maintenance*: The Monkey Chute backwater area has no operational requirements. Maintenance is conducted as needed to maintain access into the chute by eliminating shallow areas created by silt accumulation. Maintenance needs are evaluated through sedimentation monitoring, through field inspections performed by the site manager and through site visits conducted jointly by the Corps of Engineers and project sponsors after such events as flooding and/or high water. To date, maintenance has not been performed or required to access the chute, although future inspections may justify the need for maintenance and/or dredging.

2. *Sedimentation Monitoring*: Sedimentation monitoring is accomplished through inspections and surveys performed by the Missouri Department of Conservation (MDOC) and U.S. Army Corps of Engineers (Corps) along the established dredging baseline and the five MDOC transects. Monitoring to date shows how silt accumulation and scour have adjusted along the dredged area of the chute, allowing deep holes (up to 10 feet) and shallow areas (down to 1 foot) to be created near MDOC transect 5. Monkey Chute's silt accumulation and scour have been attributed to such activities as the opening and closing of Lock and Dam 21, as well as high water events. Shallow areas are the main reason that flow and access becomes limited in the chute, while the deep holes provide a winter habitat for fish. Monitoring will continue as scheduled.

B. Encourage aquatic and biological use of backwater lake

1. *Aquatic Monitoring*: Aquatic monitoring is performed by the MDOC in cooperation with the Illinois Department of Natural Resources (ILDNR). The sponsors have monitored aquatic activity by micro-tagging four paddlefish in the chute, by elecro-fishing for largemouth bass and through field inspections. The MDOC reported that fish populations can be affected by turbidity, silt covering-up eggs, carp destroying eggs by feeding and large-scale fishing of the chute. The MDOC reported in a December 2000 memo that the fish populations have improved from years past. The ILDNR also noted that Monkey Chute has become an important large mouth bass and crappie fishery, stating that stocked bass are surviving, growing and staying in the area. A fish community survey will be evaluated. Monitoring will continue as needed.

2. *Vegetation and Waterfowl Use Monitoring*: Vegetation monitoring was performed once post-construction and waterfowl use monitoring has not been performed to date. Since project completion in 1989, the vegetation growing on the dredged material has been completely voluntary, consisting of cottonwood, silver maple, box elder and black willow. The vegetation provides marginal benefits to wildlife and could be acting as a silt filter during high water events. Vegetation and waterfowl use monitoring is and will continue to be performed through field and site inspections.

Conclusions

Although silt accumulation and scour continue in the chute along the dredged area, creating some deep holes and shallow areas, the Monkey Chute backwater area continues to have main-channel flow allowing 88 acres of backwater lake to be maintained without limiting access into the chute. If access to the chute becomes limited due to shallow areas, maintenance may be required. Aquatic use of the chute seems to be constantly improving and continues to be adequate for local anglers with no fish kills reported to date.

COOPERATING AGENCY CORRESPONDENCE

MISSOURI DEPARTMENT OF CONSERVATION
FAX TRANSMISSION
P. O. BOX 428
HANNIBAL, MO 63401
PHONE: 573-248-2530 FAX: 573-248-2532

TO: CELIA KOOL (EMERGENCY MGMT)

FROM: TRAVIS MOORE

Ken asked me to offer my thoughts to you regarding Monkey Chute. I reviewed your fax and can provide the following thoughts:

You mentioned movement at transect 1, the mouth of Monkey Chute. Trees that were marked as boundary posts soon after the channel was dredged apparently fell into the river. We have noticed that there continues to be some movement at both upstream and downstream edges of the mouth. Current flowing into and out of the chute may saturate the banks and cause failures at the mouth.

As for the scour hole between transects 4 and 5, there could be a number of possible reasons for its existence and expansion. First, it is possible that the scour hole was created during the initial dredging and was never detected by me or my predecessors because it does not fall along one of the transects. It was first discovered by chance. We had purchased a new 3-D depth finder around 1995 and wanted to see if fish were using the chute. That's when we noticed the scour and verified it's existence with manual measurements.

Other possible reasons: 1) The scour may have filled with loose sediment after dredging then was flushed out during recent high water events (93, 95, 97). Since that time, vegetation on the islands has slowed water velocity and caused the bedload to be dropped farther upstream, on the islands.

2) When the dam gates are closed and flow is limited, water backs up into the

MISSOURI DEPARTMENT OF CONSERVATION

MEMORANDUM

Date: December 15, 1997

FROM: Ken Brummett

TO: Celia Kool

SUBJECT: Monkey Chute Evaluation Report

I wonder if the deep hole at Transects 4-5 is a result of the dredging. Does sediment "flow" under water to a lower elevation. That may explain the enlargement. It may be moving into the original cut, or something may be scouring the years' accumulation of fine sediment.

From the recreational fishery aspect, Monkey Chute supports a relatively high bass fishing effort by tournament anglers. Those guys naturally home in on a slack water area with good depth. Tournament weigh-ins are conducted somewhere else, so a bass caught in Monkey Chute probably has little chance of finding its way home. If normal carrying capacity of the chute for top predators (bass etc.) is only 25 lbs. per acre and a series of tournaments removes 10 lbs. per acre over a season, that is a 40% reduction. This was just an example, but we consider 10 lbs. per acre to be a relatively high harvest on a lake bass population.

Bass sampling with Sallee showed relatively few large (12-inch or longer) bass were present, but several small ones were captured. In a balanced population, we should find about 40% of the stock size (8-inch or longer) bass over 12-inches and about 20% over 15 inches. This was not so in Monkey Chute. First, the turbidity inhibits growth of sight-feeding fish, silt smothers the eggs in a nest if muddy water occurs while they are spawning, feeding activity of bottom-feeders such as carp destroys nests, flow during spawning may result in a spawning failure, and then a fisherman comes along and catches one of the few bass that are present. All these factors make life for a species that has evolved in a slack-water situation very difficult.

On a lighter note, the creation of better off-channel habitat at Cottonwood Chute may ease the pressure on game species in Monkey Chute.

I assisted Kim Graham with paddlefish micro-tagging in May. We caught 8 in Cottonwood Chute and 4 in Monkey Chute. You have the measurements on those (not total length, eye to fork of tail). The micro-tagging was part of the MICRA effort. We got too few paddlefish to make a judgement about the population. One reason I took Kim into Monkey Chute was because I was fairly confident we would find some in there.

I hope this information/opinion helps you out. If you need more, I'll be in mornings through Friday, then on annual leave until January 2.

Happy Holidays!

Mr. Jon Fleischman
U.S. Army Engineer District, Rock Island
ATTN: CEMVR-ED-DS
P. O. Box 2004
Rock Island, IL 61204-2004

Dear Mr. Fleischman:

Thank you for providing the Missouri Department of Conservation (MDC) the opportunity to review and comment on the Post-Construction Performance Evaluation Report Supplement (PERS2) for the Monkey Chute, Missouri, Habitat Rehabilitation and Enhancement Project (HREP), dated March 2001. This draft report is a product of 12 years of post-construction observations and monitoring conducted by the Rock Island District, Illinois Department of Natural Resources and MDC.

Our agency comments are minor in that we noted two references to the Monkey Chute Project being located in Iowa. Please note this error occurred in your March 7, 2001, letter of transmittal and on page 2 of the report. Other than this one comment, MDC finds the contents in the PERS2 for Monkey Chute acceptable as we totally agree with the need for future project monitoring and assessment. Also, our agency is pleased that the Monkey Chute Project was the first HREP constructed by the Rock Island District at the beginning of the Environmental Management Program. We are also extremely pleased to note that after 12 years of operation, the Monkey Chute Project is still functioning as intended.

Again, thank you for providing this opportunity to comment.

Sincerely,

DAN ZEKOR
POLICY COORDINATION SUPERVISOR
