# Outline

## Chapter Overview

- Resource Problem
- Design Methodology

## Design Details

- Shoreline Stabilization Techniques
- Lessons Learned

## Questions/Input

US Army Corps  
of Engineers®

# Resource Problem

## Increased Shoreline Erosion

- Exposure to erosive forces from wind driven wave action, river currents, and ice action
- Loss of aquatic vegetation
- More open water

## Result

- Degraded habitat in the navigation pools

US Army Corps  
of Engineers®

# Design Methodology

## Existing Information

- EM 1601
- Shore Protection Manual

## One size does not fit all

- Gradations
- Material Costs

## Philosophy

- Diversity
- Minimize rock size and thickness
- Larger gradations improved fish habitat

US Army Corps  
of Engineers®

# Design Methodology Stabilization Techniques

## Riprap

- High Degree of Precision

## Biotechnical

- Combines live vegetation and structural material

## Vegetative Stabilization

- Inexpensive

## Other Biotechnical Methods

- Synthetic Reinforcement Grid
- Willow mats or rolls

US Army Corps  
of Engineers®

# Design Methodology Stabilization Techniques

## Technique Selection

- 20% riprap, 40% biotechnical, 40% vegetative

# Design Methodology

## Cost – MVP Data

Shoreline Stabilization Cost Per Foot

US Army Corps  
of Engineers®

# Design Details

## Design Criteria

<b>Rock Slope</b>	1V:1.5H – 3H
<b>Height above Average Water Surface Elevation (feet)</b>	1 – 5
<b>Thickness (inches)</b>	18 - 36

18 August 05

One Corps Serving the Army and the Nation

US Army Corps  
of Engineers®

# Design Details

## Lessons Learned

Project	Year Constructed	Lesson Learned
Weaver Bottoms	1986	The 30" layer of rock (no filter fabric) placed at a 1V:2H slope on these islands has held up for almost 20 years.
Lake Onalaska	1989	Portions of the 18" layer of rock (w filter fabric) placed at a 1V:3H slope were severely damaged by ice action during winter freeze-thaw expansion and spring break up. Subsequent maintenance involved placing additional rock over the damaged rock at a 1V: 4H slope. This has also been damaged by ice, however the rock thickness is adequate to prevent exposure of the underlying granular material.

US Army Corps  
of Engineers®

# Design Details

## Case Studies

Site	Rock Slope	T (in)	Height above Normal Pool (feet)	10-YR FL Height (feet)	Geo-textile	Project Length (Feet)	Year
Betsey Slough	1V:2.5H	30	4.0	8.5	No		
Billy's Slough	1V:1.5H	32	3.0	12.0	No		
Dakota	1V:2H	32	2.5	5.0	No		

US Army Corps  
of Engineers®

# Rock Revetments

## Design Criteria

<b>Rock Slope</b>	1V:1.5H – 3H
<b>Height above Average Water Surface Elevation (feet)</b>	1 – 5
<b>Thickness (inches)</b>	18 - 36

18 August 05

11

US Army Corps  
of Engineers®

# Rock Revetments

## Uses

- New Construction and Existing Shoreline
- Improves shear strength of shoreline

## Lessons Learned

- 18 inch thickness placed at 1V : 3H is stable
- 1V : 4H should be used if ice action is expected

## Case Studies

- 24

US Army Corps  
of Engineers®

# Rock Groins

## Design Criteria

Top Width (feet)	2 – 5
Rock Slope	1V:1.5H – 2H
Height above Average Water Surface Elevation (feet)	1.5 – 2
Groin Length (feet)	30 – 40
Groin Spacing (feet)	120 – 240
Ratio of Groin Spacing to Groin Length	4 – 6
Key-in (feet)	5 – 10

18 August 05

13

US Army Corps  
of Engineers®

# Rock Groins

## Uses

- Mainly New Construction
  - ✓ Wave Action and Littoral Drift are the Dominant Processes

## Lessons Learned

- If ice action is anticipated, end slope should be 1V:5H
- If little scalloping observed, vegetation alone could have been used

## Case Studies

- 10

US Army Corps  
of Engineers®

# Rock Vanes

## Design Criteria

Top Width (feet)	3 – 5
Rock Slope	1V:1.5H – 3H
Height above Average WSE (feet)	1.5 – 2
Top Elevation Slope	10 – 12%
Length	30 – 45
Hook Length (J-Hook vanes only)	30 – 45
Angle ( $\theta$ )	40 – 55
Spacing Ratio (Length to Spacing)	1:3 - 4

18 August 05

15

US Army Corps  
of Engineers®

# Rock Vanes

18 August 05

16

One Corps Serving the Army and the Nation

US Army Corps  
of Engineers®

# Rock Vanes

## Uses

- New Construction and Existing Shoreline
  - ✓ Adjacent to moving current
  - ✓ More economical than groins in deeper water

## Lessons Learned

- Stabilized bank, but reshaping is still occurring.

## Case Studies

- 3

US Army Corps  
of Engineers®

# Offshore Rock Mounds

## Design Criteria

<b>Top Width (feet)</b>	3 – 5
<b>Rock Slope</b>	1V:1.5H – 3H
<b>Height above Average WSE (feet)</b>	1.5 – 2

18 August 05

18

US Army Corps  
of Engineers®

# Offshore Rock Mounds

## Uses

- Shoreline with shallow nearshore bathymetry
- Low shorelines or marsh area
- Shorelines with heavy wood debris

## Lessons Learned

- Design top elevations need to account for settling
- Settling has continued over time

## Case Studies

- 14

US Army Corps  
of Engineers®

# Rock-Log Structures

## Design Criteria

Minimum Rock Cover Needed (feet)	Typical Bottom Elev Required and Elevation of Tree Trunk
2.0' if 15' of tree is covered by rock 1.5' if 20' of tree is covered by rock	628.0 to 628.5 = Bottom 630.0 to 630.5 = Tree Trunk

18 August 05

One Corps Serving the Army and the Nation

20

US Army Corps  
of Engineers®

# Chevrons

18 August 05

21

US Army Corps  
of Engineers®

# Chevrons

## Uses

- Allow better control of flow splits between the main and side channels
- Scour holes on the downstream side improve habitat diversity
- Wide reaches of the river, where a typical dike is not feasible

## Lessons Learned

- Better if several are used in a series
- Bank revetment is typically needed on the near bank of the structures

US Army Corps  
of Engineers®

# Berms and Vegetation

## Design Criteria

<b>Berm Width (feet)</b>	25 – 40
<b>Slope to Top Elevation</b>	1V:3H or flatter
<b>Height above Average Water Surface Elevation (feet)</b>	1.5 – 3

18 August 05

23

US Army Corps  
of Engineers®

# Berms and Vegetation

## Uses

- New Construction and Existing Shoreline
  - ✓ Offshore velocities <3 fps, wind fetch < 0.5 mile
  - ✓ Ice action and boat wave minimal

## Lessons Learned

- Low elevation berms placed along the shoreline will naturally colonize
- Vegetation is not adequate if the shoreline is exposed to sustained wave and ice action.
- 20 – 30 ft berms have been stable

## Case Studies

- 7

US Army Corps  
of Engineers®

# Loafing Habitat

## Design Criteria

<b>Height above summer pool (inches)</b>	2 – 12
<b>Length (feet)</b>	25 - 60
<b>Tree Species</b>	Black Locust, White Oak
<b>Location</b>	Sheltered Areas
